Practitioner's Docket No. ___55,595 (45107)___

| CHAPTER II |

TRANSMITTAL LETTER
TO THE UNITED STATES ELECTED OFFICE (EO/US)

(ENTRY INTO U.S. NATIONAL PHASE UNDER CHAPTER II)

PCT/DE99/02406 ✓	August 2, 1999 ✓	August 7, 1998 ✓
INTERNATIONAL APPLICATION NO.	INTERNATIONAL FILING DATE	PRIORITY DATE CLAIMED

METHOD AND ARRANGEMENT FOR MOTION ESTIMATION IN A DIGITIZED PICTURE HAVING PIXELS

TITLE OF INVENTION

Jürgen PANDEL; Gero BÄSE; Norbert ÖRTEL

APPLICANT(S)

Box PCT
Assistant Commissioner for Patents
Washington D.C. 20231
      ATTENTION: EO/US

NOTE: To avoid abandonment of the application, the applicant shall furnish to the USPTO, not later than 20 months from
        the priority date: (1) a copy of the international application, unless it has been previously communicated by the
        International Bureau or unless it was originally filed in the USPTO; and (2) the basic national fee (see 37 C.F.R. §
        1.492(a)). The 30-month time limit may not be extended. 37 C.F.R. § 1.495.

CERTIFICATION UNDER 37 C.F.R. 1.10*
(Express Mail label number is **mandatory**.)
(Express Mail certification is optional.)

I hereby certify that this correspondence and the documents referred to as attached therein are being deposited with the
United States Postal Service on this date _February 6, 2001_, in an envelope as "Express Mail Post Office to Addressee,"
Mailing Label Number _EL196831827US_, addressed to the: Assistant Commissioner for Patents, Washington, D.C. 20231.

                                            Laura M. McGuire
                                            (type or print name of person mailing paper)

                                            Signature of person mailing paper

WARNING: Certificate of mailing (first class) or facsimile transmission procedures of 37 C.F.R. 1.8 cannot be used
            to obtain a date of mailing or transmission for this correspondence.

*WARNING: Each paper or fee filed by "Express Mail" **must** have the number of the "Express Mail" mailing label
            placed thereon prior to mailing. 37 C.F.R. 1.10(b).
            "Since the filing of correspondence under § 1.10 without the Express Mail mailing label thereon is an
            oversight that can be avoided by the exercise of reasonable care, requests for waiver of this requirement
            will **not** be granted on petition." Notice of Oct. 24, 1996, 60 Fed. Reg. 56,439, at 56,442.

                        (Transmittal Letter to the United States Elected Office (EO/US)—page 1 of 8)

WARNING: *Where the items are those which can be submitted to complete the entry of the international application into the national phase are subsequent to 30 months from the priority date the application is still considered to be in the international state and if mailing procedures are utilized to obtain a date the express mail procedure of 37 C.F.R. §1.10 must be used (since international application papers are not covered by an ordinary certificate of mailing - See 37 C.F.R. §1.8.*

NOTE: *Documents and fees must be clearly identified as a submission to enter the national state under 35 USC 371 otherwise the submission will be considered as being made under 35 USC 111. 37 C.F.R. § 1.494(f).*

1.   Applicant herewith submits to the United States Elected Office (EO/US) the following items under 35 U.S.C. 371:

    a.   [**X**]   This express request to immediately begin national examination procedures (35 U.S.C. 371(f)).

    b.   [**✗**]   The U.S. National Fee (35 U.S.C. 371(c)(1)) and other fees (37 C.F.R. § 1.492) as indicated below:

2. Fees

CLAIMS FEE	(1) FOR	(2) NUMBER FILED	(3) NUMBER EXTRA	(4) RATE	(5) CALCULA-TIONS
[ ]	TOTAL CLAIMS	10 -20 =		x $ 18.00 =	$0
	INDEPENDENT CLAIMS	2 - 3 =		x $ 78.00 =	0
	MULTIPLE DEPENDENT CLAIM(S) (if applicable) + $260.00				260.00

BASIC FEE**	[ ] U.S. PTO WAS INTERNATIONAL PRELIMINARY EXAMINATION AUTHORITY
	Where an International preliminary examination fee as set forth in § 1.482 has been paid on the international application to the U.S. PTO:
	  [ ] and the international preliminary examination report states that the criteria of novelty, inventive step (non-obviousness) and industrial activity, as defined in PCT Article 33(2) to (4) have been satisfied for all the claims presented in the application entering the national stage (37 CFR 1.492(a)(4)) $96.00
	  [ ] and the above requirements are not met (37 CFR 1.492(a)(1))
	  .... $670.00
	
	[X] U.S. PTO WAS NOT INTERNATIONAL PRELIMINARY EXAMINATION AUTHORITY
	Where no international preliminary examination fee as set forth in § 1.482 has been paid to the U.S. PTO, and payment of an international search fee as set forth in § 1.445(a)(2) to the U.S. PTO:
	  [ ] has been paid (37 CFR 1.492(a)(2)) $760.00
	  [ ] has not been paid (37 CFR 1.492(a)(3)) $970.00
	  [X] where a search report on the international application has been prepared by the European Patent Office or the Japanese Patent Office (37 CFR 1.492(a)(5)) $840.00
					$ 840.00

	Total of above Calculations			=$ 1110.00	
SMALL ENTITY	Reduction by ½ for filing by small entity, if applicable. Affidavit must be filed. (note 37 CFR 1.9, 1.27, 1.28)				-
	Subtotal			$ 1110.00	
	Total National Fee			$	
	Fee for recording the enclosed assignment document $40.00 (37 CFR 1.21(h)). (See Item 13 below). See attached "ASSIGNMENT COVER SHEET".				
TOTAL	Total Fees enclosed			$ 1110.00	

i.   [X]   A check in the amount of $ 1110.00 cover the above fees is enclosed.
ii. [ ]   Please charge Account No. _____ in the amount of $ _____.
     A duplicate copy of this sheet is enclosed.

**WARNING: *"To avoid abandonment of the application the applicant shall furnish to the United States Patent and Trademark Office not later than the expiration of 30 months from the priority date: * * * (2) the basic national fee (see § 1.492(a)). The 30-month time limit may not be extended." 37 C.F.R. § 1.495(b).*

WARNING: *If the translation of the international application and/or the oath or declaration have not been submitted by the applicant within thirty (30) months from the priority date, such requirements may be met within a time period set by the Office. 37 C.F.R. § 1.495(b)(2). The payment of the surcharge set forth in § 1.492(e) is required as a condition for accepting the oath or declaration later than thirty (30) months after the priority date. The payment of the processing fee set forth in § 1.492(f) is required for acceptance of an English translation later than thirty (30) months after the priority date. Failure to comply with these requirements will result in abandonment of the application. The provisions of § 1.136 apply to the period which is set. Notice of Jan. 3, 1993, 1147 O.G. 29 to 40.*

3.   [X]   A copy of the International application as filed (35 U.S.C. 371(c)(2)):

NOTE: *Section 1.495 (b) was amended to require that the basic national fee and a copy of the international application must be filed with the Office by 30 months from the priority date to avoid abandonment "The International Bureau normally provides the copy of the international application to the Office in accordance with PCT Article 20. At the same time, the International Bureau notifies applicant of the communication to the Office. In accordance with PCT Rule 47.1, that notice shall be accepted by all designated offices as conclusive evidence that the communication has duly taken place. Thus, if the applicant desires to enter the national stage, the applicant normally need only check to be sure the notice from the International Bureau has been received and then pay the basic national fee by 30 months from the priority date." Notice of Jan. 7, 1993, 1147 O.G. 29 to 40, at 35-36. See item 14c below.*

a.   [X]   is transmitted herewith.
b.   [ ]   is not required, as the application was filed with the United States Receiving Office.
c.   [ ]   has been transmitted
     i.   [ ]   by the International Bureau.
          Date of mailing of the application (from form PCT/IB/308): _____.
     ii. [ ]   by applicant on _____.
                                   Date

4.   [X]   A translation of the International application into the English language (35 U.S.C. 371(c)(2)):
a.   [X]   is transmitted herewith.
b.   [ ]   is not required as the application was filed in English.
c.   [ ]   was previously transmitted by applicant on _____.
                                                            Date
d.   [ ]   will follow.

5. [X] Amendments to the claims of the International application under PCT Article 19 (35 U.S.C. 371(c)(3)):

NOTE: *The Notice of January 7, 1993 points out that 37 C.F.R. § 1.495(a) was amended to clarify the existing and continuing practice that PCT Article 19 amendments must be submitted by 30 months from the priority date and this deadline may not be extended. The Notice further advises that: "The failure to do so will not result in loss of the subject matter of the PCT Article 19 amendments. Applicant may submit that subject matter in a preliminary amendment filed under section 1.121. In many cases, filing an amendment under section 1 121 is preferable since grammatical or idiomatic errors may be corrected." 1147 O.G. 29-40, at 36.*

    a.   [ ]   are transmitted herewith.
    b.   [ ]   have been transmitted
        i.   [ ]   by the International Bureau.
            Date of mailing of the amendment (from form PCT/IB/308): _____.
        ii.   [ ]   by applicant on _____.
                             Date
    c.   [X]   have not been transmitted as
        i.   [X]   applicant chose not to make amendments under PCT Article 19.
            Date of mailing of Search Report (from form PCT/ISA/210): ___January 19, 2000___.
        ii.   [ ]   the time limit for the submission of amendments has not yet expired. The amendments or a statement that amendments have not been made will be transmitted before the expiration of the time limit under PCT Rule 46.1.

6. [X] A translation of the amendments to the claims under PCT Article 19 (38 U.S.C. 371(c)(3)):
    a.   [ ]   is transmitted herewith.
    b.   [ ]   is not required as the amendments were made in the English language.
    c.   [X]   has not been transmitted for reasons indicated at point 5(c) above.

7. [X] A copy of the international examination report (PCT/IPEA/409)
        [X]   is transmitted herewith.
        [ ]   is not required as the application was filed with the United States Receiving Office.

8. [X] Annex(es) to the international preliminary examination report
    a.   [X]   is/are transmitted herewith.
    b.   [ ]   is/are not required as the application was filed with the United States Receiving Office.

9. [X] A translation of the annexes to the international preliminary examination report
    a.   [X]   is transmitted herewith.
    b.   [ ]   is not required as the annexes are in the English language.

10. [X] An oath or declaration of the inventor (35 U.S.C. 371(c)(4)) complying with 35 U.S.C. 115
    a.   [ ]   was previously submitted by applicant on _____.
                                       Date
    b.   [ ]   is submitted herewith, and such oath or declaration
        i.   [ ]   is attached to the application.

ii.   [ ]   identifies the application and any amendments under PCT Article 19 that were transmitted as stated in points 3(b) or 3(c) and 5(b); and states that they were reviewed by the inventor as required by 37 C.F.R. 1.70.

iii.   [X]   will follow.

Other document(s) or information included:

11.   [X]   An International Search Report (PCT/ISA/210) or Declaration under PCT Article 17(2)(a):

a.   [X]   is transmitted herewith.

b.   [ ]   has been transmitted by the International Bureau.
Date of mailing (from form PCT/IB/308): _____.

c.   [ ]   is not required, as the application was searched by the United States International Searching Authority.

d.   [ ]   will be transmitted promptly upon request.

e.   [ ]   has been submitted by applicant on _____.

_____

AUTHORIZATION TO CHARGE ADDITIONAL FEES

WARNING: *Accurately count claims, especially multiple dependent claims, to avoid unexpected high charges if extra claims are authorized.*

NOTE: *"A written request may be submitted in an application that is an authorization to treat any concurrent or future reply, requiring a petition for an extension of time under this paragraph for its timely submission, as incorporating a petition for extension of time for the appropriate length of time. An authorization to charge all required fees, fees under § 1.17, or all required extension of time fees will be treated as a constructive petition for an extension of time in any concurrent or future reply requiring a petition for an extension of time under this paragraph for its timely submission. Submission of the fee set forth in § 1.17(a) will also be treated as a constructive petition for an extension of time in any concurrent reply requiring a petition for an extension of time under this paragraph for its timely submission." 37 C.F.R. § 1.136(a)(3).*

NOTE: *"Amounts of twenty-five dollars or less will not be returned unless specifically requested within a reasonable time, nor will the payer be notified of such amounts; amounts over twenty-five dollars may be returned by check or, if requested, by credit to a deposit account." 37 C.F.R. § 1.26(a).*

[X] The Commissioner is hereby authorized to charge the following additional fees that may
be required by this paper and during the entire pendency of this application to
Account No. ___.

[X]   37 C.F.R. 1.492(a)(1), (2), (3), and (4) (filing fees)

WARNING: *Because failure to pay the national fee within 30 months without extension (37 C.F.R. § 1.495(b)(2)) results in abandonment of the application, it would be best to always check the above box.*

[X]   37 C.F.R. 1.492(b), (c) and (d) (presentation of extra claims)

NOTE: *Because additional fees for excess or multiple dependent claims not paid on filing or on later presentation must only be paid or these claims cancelled by amendment prior to the expiration of the time period set for response by the PTO in any notice of fee deficiency (37 C.F.R. § 1.492(d)), it might be best not to authorize the PTO to charge additional claim fees, except possible when dealing with amendments after final action.*

[X]   37 C.F.R. 1.17 (application processing fees)
[X]   37 C.F.R. 1.17(a)(1)-(5)(extension fees pursuant to § 1.136(a).
[ ]   37 C.F.R. 1.18 (issue fee at or before mailing of Notice of Allowance,
        pursuant to 37 C.F.R. 1.311(b))

NOTE: *Where an authorization to charge the issue fee to a deposit account has been filed before the mailing of a Notice of Allowance, the issue fee will be automatically charged to the deposit account at the time of mailing the notice of allowance. 37 C.F.R. § 1.311(b).*

NOTE: *37 C.F.R. 1.28(b) requires "Notification of any change in loss of entitlement to small entity status must be filed in*

the application . . . prior to paying, or at the time of paying . . . issue fee." From the wording of 37 C.F.R. §
1.28(b): (a) notification of change of status must be made even if the fee is paid as "other than a small entity" and
(b) no notification is required if the change is to another small entity.

[ ]   37 C.F.R. § 1.492(e) and (f) (surcharge fees for filing the declaration and/or filing an English translation of an International Application later than 30 months after the priority date).

For: METHOD AND ARRANGEMENT FOR MOTION ESTIMATION IN A
       DIGITIZED PICTURE HAVING PIXELS

Assistant Commissioner For Patents
Washington, D.C. 20231
Sir:

PRELIMINARY AMENDMENT

Applicants file herewith the above application. Please amend the application as follows.

IN THE CLAIMS

Please cancel claims 1-10 without prejudice.

Please add the following new claims.

11.   A method for motion estimation in a digitized image having pixels, comprising:

grouping pixels in picture blocks,

in which the pixels are grouped to form at least one first picture area and one second

picture area;

wherein first motion estimation is carried out in a first search area for at least one picture

block in the first picture area to determine a first motion vector whereby movement of the first

picture block is described in comparison to the first picture block in a preceding predecessor

picture and/or in comparison to the first picture block in a subsequent successor picture;

wherein second motion estimation is carried out in a second search area for at least one

second picture block in the second search area to determine a second motion vector whereby

movement of the second picture block is described in comparison to the second picture block in a

preceding predecessor picture and/or in comparison to the second picture block in a subsequent

successor picture;

wherein the first search area and the second search area are of different sizes; and

wherein the size of the first search area and/or of the second search area is varied as a function of a predetermined picture quality, whereby the first picture block and/or the second picture block are/is coded.

12.   The method of claim 11 wherein the size of the first search area and/or of the second search area are/is varied as a function of a quantization parameter whereby the first picture block and/or the second picture block are/is quantized.

13.   The method of claim 11 used for coding the digitized picture.

14.   The method of claim 13 wherein variable length coding of the motion vectors is carried out; and a number of stored, different tables, in which codes for variable length coding are stored, are used for variable length coding.

15.   The method of claim 14 wherein the tables are matched to the maximum length of the motion vectors.

16.   An arrangement for motion estimation in a digitized image having pixels, comprising:

a processor which is set up such that the following steps can be carried out:

the pixels are grouped in picture blocks;

the pixels are grouped to form at least one first picture area and one second picture area;

first motion estimation is carried out in a first search area for at least one picture block in the first picture area to determine a first motion vector whereby movement of the first picture block is described in comparison to the first picture block in a preceding predecessor picture and/or in comparison to the first picture block in a subsequent successor picture;

second motion estimation is carried out in a second search area for at least one second picture block in the second search area to determine a second motion vector whereby movement of the second picture block is described in comparison to the second picture block in a preceding predecessor picture and/or in comparison to the second picture block in a subsequent successor picture;

in which the first search area and the second search area are of different sizes; and

in which the size of the first search area and/or of the second search area is varied as a function of a predetermined picture quality, whereby the first picture block and/or the second picture block are/is coded.

17.   The arrangement of claim 16 wherein the processor is set up such that the size of the first search area and/or of the second search area are/is varied as a function of a quantization parameter whereby the first picture block and/or the second picture block are/is quantized.

18.   The arrangement of claim 16 used in a picture coding device.

19.   The arrangement of claim 16, used in a picture coding device,

wherein the processor is set up such that, variable length coding of the motion vectors is carried out; and a number of stored, different tables, in which codes for variable length coding are stored, are used for variable length coding.
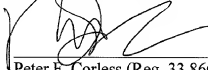

20.   The arrangement of claim 19 wherein the processor is set up such that the tables are matched to the maximum length of the motion vectors.

REMARKS

Claims 1-10 have been cancelled without prejudice, and claims 11-20 have been added. The new claims merely conform to matters of form of U.S. practice.

Early consideration and allowance of the application are earnestly solicited.

Respectfully submitted,

Description

Method and arrangement for motion estimation in a digitized picture having pixels

5   The invention relates to motion estimation in a digitized picture having pixels.

Such a method is known from [1].

10   In the method for motion estimation from [1], pixels of a digitized block for which the motion estimation is intended to be carried out are grouped into picture blocks.

15   For each picture block in the picture, an attempt is made within a search area whose size can be preset to determine an area of the size of the picture block in which the similarity of the coding information which is

20   contained in the picture block for which the motion estimation is being carried out matches as well as possible.

In the following text, the term coding information

25   means brightness information (luminance values) or color information (chrominance values) which are each associated with a pixel.

For this purpose, in a preceding picture and based on

30   the position in which the picture block is located in the preceding picture, a region of the corresponding block size with the same number of pixels as those contained in the picture block is in each case formed for each position in an area whose size (search area)

35   can be predetermined, and the sum of the square or absolute difference of the coding information is formed between the picture block for which the motion estimation is intended to be carried out and the

ART.34 AMDT

respective region in the preceding picture. The region
which matches best, that is to say has the minimum sum
value, is regarded as the matching picture block and
the movement in the position of the picture block

5 between the "best" region in the preceding picture and
that picture block is determined. This movement is
referred to as the motion vector.

The document Oh et al "Block-matching algorithm based

10 on dynamic adjustment of search window for low bit-rate
video coding", Journal of Electronic Imaging, US,
Volume 7, No. 3, July 1998, pages 571-577 describes a
method for motion estimation of objects in a video
sequence using a block matching algorithm, and the use

15 of the motion vectors determined by means of this
method for compression of the video data. For
estimation of the motion vectors, the individual video
pictures are broken down into blocks of NxN pixels. For
each picture block in the current video picture, the

20 associated, best-matching picture block in a preceding
reference video picture is determined, and the sought
motion vector for this picture block is determined from
the difference in the position of the block in the two
video pictures. The method in this case uses a search

25 area of variable size, in which matching picture blocks
are looked for within the reference video picture.

The document US-A-5 537 155 describes a method for
video compression, in which motion estimation is

30 carried out between the individual pictures in a video
sequence. Motion estimation is carried out using a
block matching algorithm in which the picture blocks in
the present video picture are compared with picture
blocks from a preceding video picture. This comparison

AMENDED SHEET

is carried out with a respectively different step width
in different search areas. The search is carried out
with a small step width around the position of the
present picture block in a first search area within the
5   comparison picture. Searches are then carried out with
correspondingly larger step widths in larger areas
around the present picture block.

When the corresponding video block in the comparison
10 picture is found, this thus defines the motion vector
for this block, which is then used for coding that
video block.

The invention is based on the problem of providing a
15 method and an apparatus for motion estimation in which
the total number of bits required overall for coding
the motion vectors is reduced.

The problem is solved by the method and by the
20 arrangement according to the features of the
independent patent claims.

In the case of the method for motion estimation of a
digitized picture having pixels, the pixels are grouped
25 into picture blocks. The pixels are grouped at least
into a first picture area and a second picture area.
First motion estimation is carried out in a first
search area for at least a first picture block in the
first picture area in order to determine a first motion
30 vector by means of which a movement of the first
picture block is described in comparison to the first
picture block in a preceding predecessor picture,
and/or in comparison to the first picture block in a

AMENDED SHEET

subsequent successor picture. Furthermore, second motion estimation is carried out in a second search area for at least one second picture block in the second picture area in order to determine a second motion vector by means of which a movement of the second picture block is described in comparison to the second picture block in a preceding predecessor picture and/or in comparison to the second picture block in a subsequent successor picture. The first search area and

the second search area are in this case of different
sizes.

The arrangement for motion estimation of a digitized
5   picture having pixels has a processor which is set up
such that the following steps can be carried out:
- the pixels are grouped into picture blocks,
- the pixels are grouped to form at least one first
picture area and one second picture area,
10 - first motion estimation is carried out in a first
search area for at least one first picture block in the
first picture area in order to determine a first motion
vector by means of which a movement of the first
picture block is described in comparison to the first
15 picture block in a preceding predecessor picture and/or
in comparison to the first picture block in a
subsequent successor picture,
- second motion estimation is carried out in a second
search area for at least one second picture block in
20 the second picture area in order to determine a second
motion vector by means of which a movement of the
second picture block is described in comparison to the
second picture block in a preceding predecessor picture
and/or in comparison to the second picture block in a
25 subsequent successor picture, and
- the first search area and the second search area are
of different sizes.

The invention makes it possible to reduce the required
30 data rate for transmission of compressed video data,
since the size of the motion vectors can be adaptively
matched to qualitative requirements and thus, without
noticeably detracting from the subjective impression of
the quality of a picture, only a very small search area
35 is provided even, for example, in regions in which only
low quality is required. The maximum size of a motion
vector in this search area is thus relatively small,

which results in the number of bits for coding the
motion vector being reduced.

The invention can evidently be seen in the fact that
5   search areas of different size are used for picture
areas for motion estimation of the picture blocks in
the picture areas, which results in flexible reduction,
matched to the quality, of the required data rate for
coding for motion vectors.
10

Advantageous developments of the invention result from
the dependent claims.

One development provides for the size of the first
15   search area and/or of the second search area to be
varied as a function of a predetermined picture
quality, by means of which the first picture block
and/or the second picture block are/is coded.

20   In this way, a measure for limiting the search areas is
specified, which allows a reduction in the required
data rate taking account of the required picture
quality.

25   One extremely simple criterion for determining the size
of the respective search area, in one development, is a
quantization parameter by means of which the first
picture block and/or the second picture block are/is
quantized.
30

A further refinement provides for a number of tables,
in which codes for variable length coding are stored,
to be used for variable length coding of the motion
vectors, and this results in a further reduction in the
35   required data rate for transmission of the video data.

An exemplary embodiment of the invention will be
explained in more detail in the following text and is
illustrated in the figures, in which:

5   Figures 1a to 1c show a sketch of a picture and of a
              preceding picture, in which the principle on
              which the invention is based is illustrated;
    Figure 2 shows an arrangement of two computers, a
              camera and a screen, by means of which the
10   video data are coded, transmitted, decoded
              and displayed;
    Figure 3 shows a sketch of an apparatus for block-
              based coding of a digitized picture.

15 **Figure 2** shows an arrangement which comprises two
    computers 202, 208 and a camera 201, showing picture
    coding, transmission of the video data, and picture
    decoding.

20 A camera 201 is connected to a first computer 202 via a
    line 219. The camera 201 transmits pictures 204 it has
    filmed to the first computer 202. The first computer
    202 has a first processor 203 which is connected via a
    bus 218 to a frame memory 205. A method for picture
25 coding is carried out by the first processor 203 in the
    first computer 202. In this way, coded video data 206
    are transmitted from the first computer 202 via a
    communications link 207, preferably a cable or a radio
    path, to a second computer 208. The second computer 208
30 contains a second processor 209, which is connected to
    a frame memory 211 via a bus 210. A method for picture
    decoding is carried out by means of the second
    processor 209.

35 Both the first computer 202 and the second computer 208
    have a respective screen 212 or 213, on which the video
    data 204 are displayed. Input units, preferably a
    keyboard 214 or 215 and a computer mouse 216 or 217,

are respectively provided for both the first computer
202 and the second computer 208.

The video data 204 which are transmitted from the
5 camera 201 via the line 219 to the first computer 202
are data in the time domain, while the data 206 which
are transmitted from the first computer 202 to the
second computer 208 via the communications link 207 are
video data in the spectral domain.
10
The decoded video data are displayed on a screen 213.

Figure 3 shows a sketch of an arrangement for carrying
out a block-based picture coding method in accordance
15 with the H.263 Standard (see [5]).

A video data stream to be coded and having successive
digitized pictures is supplied to a picture coding unit
301. The digitized pictures are subdivided into macro
20 blocks 302, with each macro block containing 16x16
pixels. The macro block 302 comprises four picture
blocks 303, 304, 305 and 306, with each picture block
containing 8x8 pixels, to which luminance values
(brightness values) are assigned. Furthermore, each
25 macro block 302 comprises two chrominance blocks 307
and 308 having the chrominance values assigned to the
pixels (color information, color saturation).

The block in a picture contains a luminance value
30 (= brightness), a first chrominance value and a second
chrominance value. In this case, the luminance value,
the first chrominance value and the second chrominance
value are referred to as color values.

35 The picture blocks are supplied to a transformation
coding unit 309. During difference-picture coding, the
values to be coded from picture blocks from preceding
pictures are subtracted from the picture blocks to be

coded at that time, and only the difference-forming
information 310 is supplied to the transformation
coding unit (Discrete Cosine Transformation, DCT) 309.
For this purpose, the present macro block 302 is
5   signaled to a motion estimation unit 329 via a link
334. In the transformation coding unit 309, spectral
coefficients 311 are formed for the picture blocks or
difference picture blocks to be coded, and are supplied
to a quantization unit 312.

10

Quantized spectral coefficients 313 are supplied both
to a scanning unit 314 and to an inverse quantization
315 in a feedback path. Using a scanning method, for
example a "zigzag" scanning method, entropy coding is
15   carried out on the scanned spectral coefficients 332 in
an entropy coding unit 316 provided for this purpose.
The entropy-coded spectral coefficients are transmitted
as coded video data 317 via a channel, preferably a
cable or a radio path, to a decoder.

20

Inverse quantization of the quantized spectral
coefficients 313 is carried out in the inverse
quantization unit 315. Spectral coefficients 318
obtained in this way are supplied to an inverse
25   transformation coding unit 319 (Inverse Discrete Cosine
Transformation, IDCT). Reconstructed coding values (and
difference coding values) 320 are supplied to an adder
321 in the difference-forming mode. The adder 321 also
receives coding values for a picture block, which are
30   obtained from a preceding picture once motion
compensation has already been carried out. The adder
321 is used to form reconstructed picture blocks 322,
which are stored in a frame memory 323.

35   Chrominance values 324 of the reconstructed picture
blocks 322 are supplied from the frame memory 323 to a
motion compensation unit 325. For brightness values
326, interpolation is carried out in an interpolation

unit 327 provided for this purpose. The interpolation
is preferably used to quadruple the number of
brightness values contained in the respective picture
block. All the brightness values 328 are supplied not
5   only to the motion compensation unit 325 but also to
the motion estimation unit 329. The motion estimation
unit 329 also receives the picture blocks for the
respective macro block (16x16 pixels) to be coded, via
the link 334. Motion estimation is carried out in the
10 motion estimation unit 329, taking account of the
interpolated brightness values ("motion estimation on a
half-pixel basis").

The result of the motion estimation is a motion vector
15 330 which expresses a movement in the position of the
selected macro block from the preceding picture to the
macro block 302 to be coded.

Both brightness information and chrominance information
20 relating to the macro block determined by the motion
estimation unit 329 are shifted through the motion
vector 330, and are subtracted from the coding values
of the macro block 302 (see data path 231).

25 The motion estimation thus results in the motion vector
330 with two motion vector components, a first motion
vector component BV_x and a second motion vector
component BV_y along the first direction x and the
second direction y:

30

$$BV = \begin{pmatrix} BV_x \\ BV_y \end{pmatrix}$$

The motion vector 330 is assigned to the picture block.

35 The picture coding unit shown in Figure 3 thus provides
a motion vector 330 for all the picture blocks and
macro picture blocks.

Figure 1a shows a digitized picture 100 which is intended to be coded using the apparatus illustrated in Figure 3.

5   The digitized picture 100 has pixels 101 to which coding information is assigned.

The pixels 101 are grouped into picture blocks 102. The
10 picture blocks 102 are grouped into a first picture area 105 and into a second picture area 106.

In the following text, it is assumed that the quality requirements in the first picture area 105 are more
15 stringent than the requirements for the quality in the second picture area 106.

Motion estimation is carried out for a first picture block 103 in the first picture area 105. To this end, a
20 first search area 114 is defined in a preceding picture and/or in a subsequent picture 110.

Based on a starting region 113 whose shape and size are the same as those of the first picture block, the
25 following error E is in each case determined, shifted by one pixel or by a fraction or a multiple of the pixel separation (for example by half a pixel (half-pixel motion estimation)) through which the start region 113 is in each case shifted:

30
$$E \; = \; \sum_{i=1}^{n} \sum_{j=1}^{m} \left(x_{i,j} - y_{i,j}\right)^2 \; ,$$

Where

35 - i,j are sequential indices,

- n is the number of pixels in the first picture block along a first direction,
- m is the number of pixels in the first picture block along a second direction,
5 - $x_{i,j}$ is coding information for the pixel at the position i,j within the first picture block,
- $y_{i,j}$ is coding information for the pixel at the corresponding point in the previous picture, shifted through the corresponding motion vector.

10

The error E is calculated for each shift in the previous picture 110 and the picture block from that shift (= motion vector) whose error E has the lowest value is selected as that which is most similar to the
15 first picture block 103.

In this exemplary embodiment, the search area in each case covers four pixel intervals, both in the horizontal direction and in the vertical direction,
20 about a start position 113 which corresponds to the relative position of the first picture block of the first picture area in the preceding picture 110. The maximum size of a first motion vector 117 to be coded is thus $4\sqrt{2}$ pixel intervals in this case (see **Figure**
25 **1b**).

Figure 1c shows second motion estimation for a second picture block 104 in the second picture area 106. The fundamental procedure for the purposes of motion
30 estimation is also described as above for the second motion estimation.

For the second motion estimation, a second search area 116 is smaller, since the requirements for the picture
35 quality in the second picture area 106 are not as stringent as those for the first picture area 105.

For this reason, the size of the second search area 116
is only two pixels 116 in each direction, originating
from a start position 115. The maximum size of a second
motion vector 118 to be coded for the second picture

5   block 104 is thus $2\sqrt{2}$.

It can be seen from this example that considerably less
computation effort is required for coding the second
motion vector 118 than for coding the first motion

10   vector 117.

Based on this illustrative example, the size of a
search area for a picture block in the exemplary
embodiment is dependent on a quantization parameter

15   which indicates the quantization steps which were used
to code the preceding picture 100.

The size S of a search area is obtained using the
following rule:

20

$$S = 15 - QP/2$$

where

25   - S is the size of the search area, and
     - QP is the quantization parameter.

The quantization parameter QP is a factor contained in
the normal header data for H.263, and is used as the

30   start value for the quantization.

The size S of the search area for a picture block thus
becomes larger the smaller the quantization parameter
QP, which corresponds to high picture quality.

35

A number of tables, which contain different codes for
motion vectors of different length with a different

value range, are used for variable length coding of the
motion vectors.

The quantization parameter QP is used to select that
5   table for variable length coding whose table entries
for the variable length codes have a value range which
is matched to the size S of the search area, and thus
to the maximum length of the motion vector.

10   A number of alternatives to the exemplary embodiment
described above are explained below.

The type of motion estimation, and thus the way in
which the similarity measure is formed, are irrelevant
15   to the invention.

Thus, for example, the following rule can also be used
to form the error E:

20   $E = \sum\limits_{i=1}^{n} \sum\limits_{j=1}^{m} \left| x_{i,j} - y_{i,j} \right|$.

It has furthermore been shown that, for further
reduction of the required data rate, it is in many
cases even sufficient to transmit only the motion
25   vectors without also transmitting an error signal which
is produced during the formation of the difference
pictures for motion compensation.

The invention can evidently be seen in the fact that
30   search areas of different size are used for picture
areas for motion estimation of the picture blocks in
the picture areas, which results in a flexible
reduction, matched to the quality, in the required data
rate for coding of the motion vectors.

     Low Bitrate Communication, May, 1996.

ART 34 AMDT

Patent Claims

1. A method for motion estimation in a digitized
    image having pixels,
    - in which the pixels are grouped in picture
    blocks,
    - in which the pixels are grouped to form at least
    one first picture area and one second picture
    area,
    - in which first motion estimation is carried out
    in a first search area for at least one first
    picture block in the first picture area in order
    to determine a first motion vector by means of
    which a movement of the first picture block is
    described in comparison to the first picture block
    in a preceding predecessor picture and/or in
    comparison to the first picture block in a
    subsequent successor picture,
    - in which second motion estimation is carried out
    in a second search area for at least one second
    picture block in the second search area in order
    to determine a second motion vector by means of
    which a movement of the second picture block is
    described in comparison to the second picture
    block in a preceding predecessor picture and/or in
    comparison to the second picture block in a
    subsequent successor picture,
    - in which the first search area and the second
    search area are of different sizes, and
    - in which the size of the first search area
    and/or of the second search area is varied as a
    function of a predetermined picture quality, by
    means of which the first picture block and/or the
    second picture block are/is coded.

2. The method as claimed in claim 1,

AMENDED SHEET

characterized in that the size of the first search
area and/or of the second search area are/is
varied as a function of a quantization parameter
by means of which the first picture block and/or

5   the second picture block are/is quantized.

3.   The method as claimed in one of claims 1 to 2,
used for coding the digitized picture.

10   4.   The method as claimed in claim 3,
- in which variable length coding of the motion
vectors is carried out,
- in which a number of stored, different tables,
in which codes for variable length coding are

15   stored, are used for variable length coding.

5.   The method as claimed in claim 4,
characterized in that the tables are matched to
the maximum length of the motion vectors.

20

6.   An arrangement for motion estimation in a
digitized picture having pixels,
having a processor which is set up such that the
following steps can be carried out:

25   - the pixels are grouped into picture blocks,
- the pixels are grouped to form at least one
first picture area and one second picture area,
- first motion estimation is carried out in a
first search area for at least one first picture

30   block in the first picture area in order to
determine a first motion vector by means of which
a movement of the first picture block is described
in comparison to the first picture block in a
preceding predecessor picture and/or in comparison

35   to the first picture block in a subsequent
successor picture,

AMENDED SHEET

- second motion estimation is carried out in a second search area for at least one second picture block in the second picture area in order to determine a second motion vector by means of which a movement of the second picture block is described in comparison to the second picture block in a preceding predecessor picture and/or in comparison to the second picture block in a subsequent successor picture,

- the first search area and the second search area are of different sizes, and

- wherein the processor is set up such that the size of the first search area and/or of the second search area are/is varied as a function of a predetermined picture quality by means of which the first picture block and/or the second picture block are/is coded.

7. The arrangement as claimed in claim 6, wherein the processor is set up such that the size of the first search area and/or of the second search area are/is varied as a function of a quantization parameter by means of which the first picture block and/or the second picture block are/is quantized.

8. The arrangement as claimed in one of claims 6 or 7, used in a picture coding device.

9. The arrangement as claimed in one of claims 6 or 7, used in a picture coding device, wherein the processor is set up such that

- variable length coding of the motion vectors is carried out,

AMENDED SHEET

08.11.2000,
1998P02279WO
PCT/DE 99/02406

- a number of stored, different tables, in which
codes for variable length coding are stored, are
used for variable length coding.

5 10. The arrangement as claimed in claim 9,
characterized in that the processor is set up such
that the tables are matched to the maximum length
of the motion vectors.

Abstract

Method and arrangement for motion estimation in a digitized picture having pixels

The pixels are grouped into picture blocks. The pixels are grouped into at least a first picture area and a second picture area. First motion estimation is carried out in a first search area in order to determine a first motion vector. Furthermore, second motion estimation is carried out in a second search area in order to determine a second motion vector. The first search area and the second search area are of different sizes.

DECLARATION AND POWER OF ATTORNEY

As a below named inventor, I hereby declare that: My residence, post office address and citizenship are as stated below next to my name. I believe I am an original, first and joint inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled: METHOD AND ARRANGEMENT FOR MOTION ESTIMATION IN DIGITIZED PICTURE HAVING PIXELS

which is described and claimed in:

    ☐   the specification attached hereto.

    ☑   the specification in U.S. Application Serial Number _____, filed on _7 February 2001.

    ☑   the specification in PCT international application Number, **PCT/DE99/02406** filed on _____**August 2, 1999**_____; and was amended on _____.

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above. I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a). I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed.
